ANALYSE VARIOUS TYPES OF SERVERS USING WEBALIZER TOOL

AIM: To install and use the webalizer tool in Linux to analyse web server log files and generate statistical reports about server activity, website visits, hits, pages accessed, and data transferred.

REQUIREMENT:

* Fedora/Linux operating System
* webalizer tool
* Apache web server
* Web server log files (access_log)

PROCEDURE:

1) Open the Linux terminal
2) Install the Apache web server using the command: Sudo dnf install httpd -y
3) Start the Apache web server:
   Sudo systemctl start httpd
4) Install the webalizer tool: sudo dnf install webalizer.
5) Locate the Apache access log file:
   Sudo ls /var/log/httpd/
6) Generate sample server requests by opening the Browser and visiting http://localhost.
7) Check the access log file:
   sudo tail /var/log/httpd/access_log
8) Run webalizer to analyse the log file:
   sudo webalizer /var/log/httpd/access_log.
9) Open the generated report directory and view the report files. webalizer generally generates an index.html report along with supporting files.
10) Analyse the report to identify the number of hits, visits, pages, accessed, URLs requested and amount of data transferred.

OBSERVATION: The following server statistics can be analysed using webalizer:

Parameter	Description
Hits	Total requests received by the server.
visits	Estimated website visits.
Pages	Number of web pages requested.
URLS	Different URLs requested
sites	Different client hosts accessing the server.
KBytes	Amount of data transferred
Referred	Sources from which users reached the website
User agents	Browsers and client software used.

RESULT: Thus, the webalizer tool was used to analyse web server log files and generate statistical reports containing information about hits, visits, pages accessed, client hosts, and data transferred.
